

New Dock Leveler, Dock Pit, Bumpers and Dock Seal
Truline Contracting and Calgary Warehouse

Calgary, AB

Project Overview

At a warehouse in Calgary, a trailer collided with a dock due to the incline approach and poor weather conditions. The original dock bumpers were incorrectly positioned above the dock height, leaving the dock unprotected. As a result, the collision caused severe damage to both the dock and the building's wall.

We worked with Truline Contracting, who was hired by the insurance company to repair and resolve the issues at this Calgary warehouse. Truline Contracting provided a protective hoarding around the position to create a safe and secure environment for the repairs to be completed.

Once the area was tarped off, our team could cut and remove the damaged mechanical dock leveler, and repair the damaged concrete by pouring a new dock pit. We replaced the old mechanical dock leveler with a new [Blue Giant Mechanical Dock Leveler](#) and installed [Steel Face Dock Bumpers](#) at the appropriate height.

The steel face dock bumpers were 48" and aligned with the dock leveler to protect both the dock and building from any damage. Steel face dock bumpers have a longer life expectancy than laminate dock bumpers and their floating face plate can handle some of the heaviest impacts.

Finally, we installed new [Blue Giant Adjustable Head Curtain Dock Seals](#) that were reverse-tapered to match the incline approach. This helped create a tight seal around the trailers and protect the building.

- ✓ Improve safety
- ✓ Workplace productivity
- ✓ Long lasting
- ✓ Tight seal
